

pc power management made simple

Business PC energy costs have typically been hidden, but can make up a significant cost to organisations. By taking control of power management you can reduce your total PC energy bill by up to 40%, simply by eliminating unused energy costs.

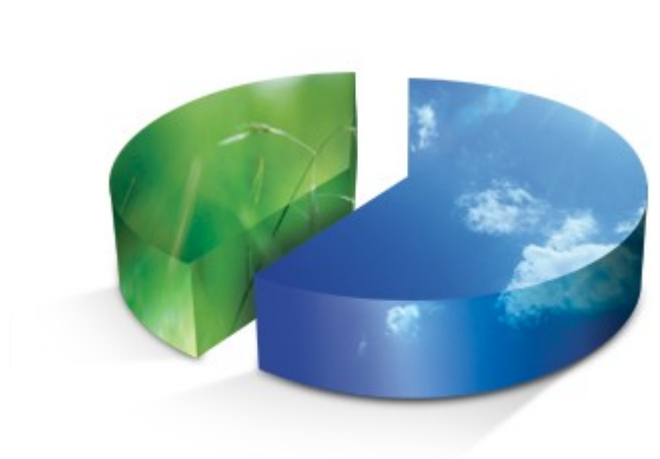

Automating power management gives you significant advantages in managing and controlling these costs without impacting user productivity, a real win-win situation.

Powerwise is innovative, inexpensive and simple to install. It powers up, powers down and powers off your PCs - automatically - to give you optimum energy savings, which helps save you money and the environment. Making savings has never felt so good!

Designed to work seamlessly in networked environments Powerwise gives you a comprehensive set of tools and management information to intelligently manage your PCs, all via an intuitive management console.

All businesses strive to improve efficiency, however combing this with green strategies such as carbon emission reduction can be seen as a challenge. Powerwise enables you to report on CO2 usage while also helping your organisations bottom line. This knowledge allows you to develop a sustainable strategy for the future.

Ask us for a no obligation quote today, and see how much you could be saving.

Reduce your PC energy costs by up to 40%

The hidden costs of running your PCs

- > On average over 50% of your organisation's computers will be left on when they needn't be.
- > Around 20% of your computers will never be turned off.
- > Wasted energy from your computers can cost you over \$60 per PC, per year.
- > That's the equivalent of over 350Kgs of unnecessary CO2 emissions annually.

Key features

- > Centralised management and control of PC power saving settings
- > Automatically power down PCs when not required
- > Automatically learns when to turn on a PC in the morning
- > Support for the latest technology: Intel vPro
- > See daily power usage data in the detailed reporting
- > Active Directory integration enhances security, deployment and management

Ease of use

The management console allows you to manage all your devices from a central point, simplifying control and making it easier to achieve a consistent energy policy. You can see real time power information about devices and track power saving events.

Use web wakeup to wake up computers from a web page, great for users who need to access their PC remotely.

Flexibility and efficiency

Configure Profiles to change how power management is set throughout the day, matching the way the users work; configure different Profiles to meet the differing needs of the workforce. For special requirements you can use Idle Options to declare special applications that will need to defer power saving events.

For maximum efficiency the adaptive wake up feature of powerwise automatically learns when a user first needs their computer and turns it on ready for them to use at the start of work.

Security and maintenance

Just because powerwise is making sure your computers are off when they are not required does not mean interfering with maintenance processes. Wake up and shutdown computers automatically out of hours to ensure essential support and maintenance such as patching is carried out effectively.

Simple Implementation

The small footprint server and agent technology can be deployed in minutes so you can be seeing a difference almost immediately. This means our customers can typically see a return on their investment within 6 months and claim to be reducing their carbon footprint immediately.

"We are just so impressed that something so user friendly cannot only save us on energy costs, but can also contribute to the eco culture that is so strong in school. It's one of those things that you think 'why didn't we do this before'. It has had an amazing impact, without causing any inconvenience at all."

Mrs Duncan, head teacher of Sunbury Manor School

Centralise the management of your PC power with powerwise and you will maximise energy savings and productivity, while you minimise your carbon footprint.
